OAuth 2.0

- Mechanism to provide applications access to restricted resources **without sharing credentials.**
 - Applications use **access tokens**, issued by OAuth providers (e.g. FIWARE), to access resources.
 - OAuth 2.0 specification is designed for use with HTTP.
- Roles:
 - **Resource Owner:** Entity capable of granting access to a protected resource (e.g. end-user)
 - **Resource Server:** Server hosting protected resources.
 - **Client:** Application making protected resource requests on behalf of the resource owner.
 - **Authorization Server:** The server issuing access tokens to the client.

OAuth 2.0 Architecture

Authorization Code Grant

OAuth consumer
myservice.com

OAuth Provider
account.lab.fiware.org

FIWARE

Using OAuth2

Authorization Code Grant

Authorization Request

```
GET /oauth2/authorize?response_type=code&client_id=1&state=xyz  
&redirect_uri=https%3A%2F%2Fclient%2Eexample%2Ecom%2Fcallback_url HTTP/1.1  
Host: account.lab.fiware.org
```

Using OAuth2

Authorization Code Grant

Authorization Response

```
HTTP/1.1 302 Found
```

```
Location: https://client.example.com/callback_url?code=Sp1x1OBeZQQYbYS6WxSbIA&state=xyz
```

Using OAuth2

Authorization Code Grant

Access Token Request

```
POST /oauth2/token HTTP/1.1
Host: account.lab.fiware.org
Authorization: Basic czZCaGRSa3F0MzpnWDFmQmF0M2JW
Content-Type: application/x-www-form-urlencoded

grant_type=authorization_code&code=Spxl0BeZQQYbYS6WxSbIA
&redirect_uri=https%3A%2F%2Fclient%2Eexample%2Fcallback_url
```

Using OAuth2

Authorization Code Grant

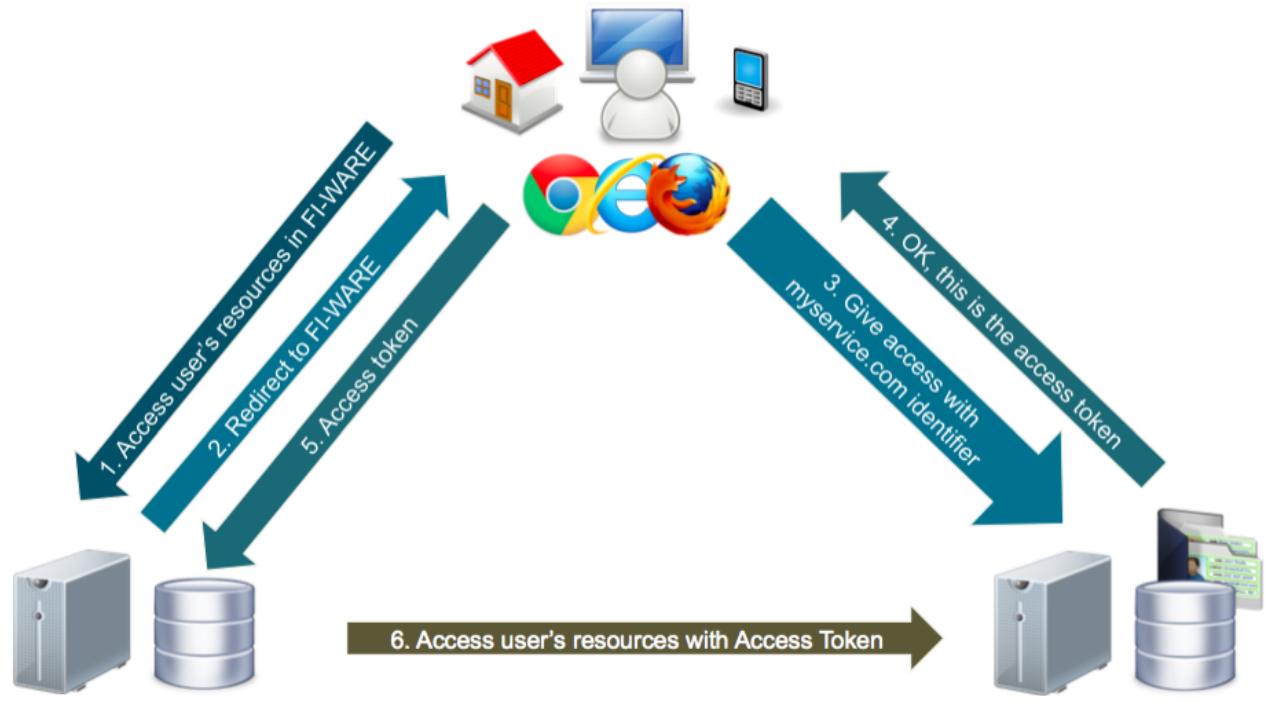

Access Token Response

```
HTTP/1.1 200 OK
Content-Type: application/json; charset=UTF-8
Cache-Control: no-store
Pragma: no-cache

{
  "access_token": "2YotnFZFEjr1zCsicMWpAA",
  "token_type": "bearer",
  "expires_in": 3600,
  "refresh_token": "tGzv3JOkF0XG5Qx2TlKWIA",
}
```

OAuth 2.0 Architecture

Implicit Grant

Level 2: Basic Authorization

The screenshot shows the FIWARE Lab Identity Manager interface. At the top, there is a navigation bar with links for Cloud, Store, Mashup, Data, Account, Help/Info, and a user profile for Alvaro Alonso. On the left, a sidebar titled "Identity Manager" contains links for Home, Organizations, My Applications (which is selected), Notify, Administrators, and User Accounts. A modal window titled "Create permission" is open in the center. The modal has fields for "Permission Name" (set to "Resource 1"), "Description" (set to "Resource 1 permission"), and "HTTP Verb and Resource Rule". Under "HTTP action", "GET" is selected. Under "Resource", the value "resource1" is entered. There is also an "Advanced XACML Rule" section which is currently empty. On the right side of the modal, there are three vertical columns: "application roles", "application roles", and "owned roles", each with a plus sign icon to add new entries. A "Save" button is located at the bottom right of the modal.

Level 3: Advanced Authorization

Level 3: Advanced Authorization

The screenshot shows the FIWARE Lab Identity Manager interface. The top navigation bar includes links for Cloud, Store, Mashup, Data, Account, Help & Info, and a user profile for Alvaro Alonso.

The left sidebar, titled "Identity Manager", lists several options: Home, Organizations, My Applications (highlighted in blue), Notify, Administrators, and User Accounts.

A modal dialog box is open, titled "Create permission". It contains fields for "Permission Name" (set to "Resource 1") and "Description" (set to "Resource 1 permission").

The dialog is divided into sections: "HTTP Verb and Resource Rule" and "Advanced XACML Rule". The "Advanced XACML Rule" section contains the following XML code:

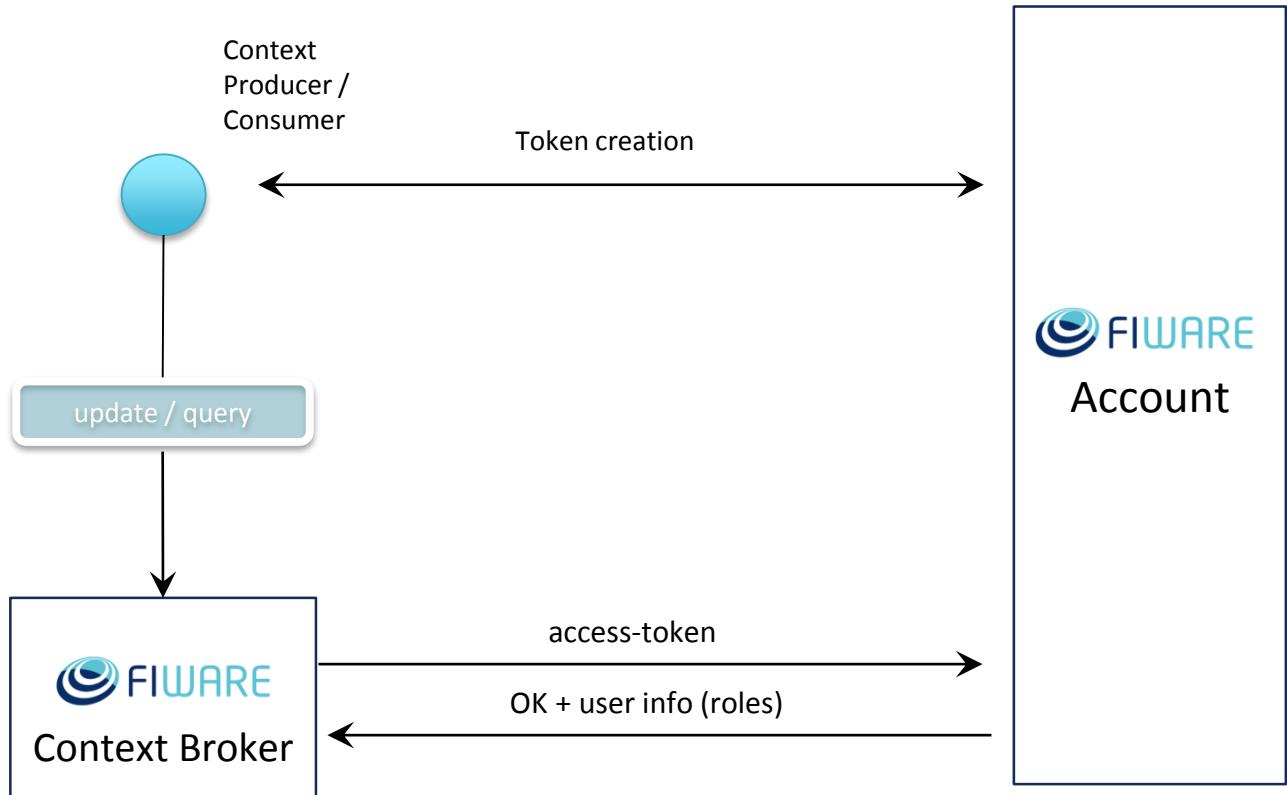

```
<Rule RuleId="MissionManager_role_can_manage_team" Effect="Permit">
    <Description>Only MissionManager role authorized to manage the mission team</Description>
    <Target>
        <AnyOf>
            <AllOf>
                <Match MatchId="urn:oasis:names:tc:xacml:1.0:function:string-equal">
                    <AttributeValue
                        DataType="http://www.w3.org/2001/XMLSchema#string">Team</AttributeValue>
```

On the right side of the dialog, there are three vertical columns labeled "application roles", "application roles", and "owned roles", each with a plus sign icon to add new entries. A "Save" button is located at the bottom right of the dialog.

- Global instance

Security GEs – Authorization PDP – AuthZForce (1/2)

By 2020, the majority of enterprises will use ABAC as the dominant mechanism to protect critical assets, up from less than five percent today. (Gartner, 2013)

- Single Open Spec (**Authorization PDP GE**) & Open Source implementation (GEri Authzforce) of 100% **XACML-3.0** standard-compliant and **cloud-ready RESTful ABAC** framework with **XML optimization**
- Multi-tenant REST API for PDP(s)/PAP(s)
- Standards:
 - OASIS: **XACML 3.0 + Profiles** (REST, RBAC, Multiple Decision)
 - ISO: **Fast Infoset**
- Extensible: attribute providers (PIP), functions, etc.
- PDP clustering

Security GEs – Authorization PDP – AuthZForce (2/2)

RBAC vs. ABAC

- Role explosion example:
 - Roles in a bank: *Teller, Supervisor, Branch director*
 - Many bank agencies: *Paris, London, Berlin*
 - What about *Teller in Paris, Teller in London, Teller in Berlin, Supervisor in Paris, Supervisor in London...?* → **9 roles!**
- RBAC 😞 / ABAC 😊: Doctor-patient and patient-record relationships
 - Doctor may only access medical records of his/her own patients
If *resource.type = 'MEDICAL_RECORD'*
AND *action.id* in {'read', 'write'}
AND *user.id = medical_record.doctor_id*, then Permit
 - A patient may only access medical records about him/herself
If *resource.type = 'MEDICAL_RECORD'*
AND *action.id = 'read'*
AND *user.id = medical_record.patient_id*, then Permit
- RBAC 😞 / ABAC 😊: Dynamic separation of duties
 - User may approve purchase order only if not assigned to him/herself (*approver ≠ assignee*)
 - ABAC-style (deny unless permit):
If *resource.type = 'PURCHASE_ORDER'*
AND *action.id = 'approve'*
AND *user.id ≠ purchase_order.assignee*, then Permit

XACML Policy Language

XACML Request

XACML v3.0 vs. v2.0: upgrade!

- **More advanced and flexible Target matching capabilities**
- **Custom attribute categories** (limited to Resource, Action, Environment and a few Subject categories in v2.0)
- **Dynamic Obligations** using variables evaluated at runtime (limited to static values in v2.0) from request context after possible transformations by XACML functions
- **Obligations in Rules** (limited to Policies and PolicySets in v2.0)

FIWARE ABAC Architecture
